

Workout Tracker - Claude Code Handoff

Expo Router React Native app for tracking workouts, exercise history, and progress locally.

What the project is about

The app lets users log workouts, store sets and notes, track exercise photos, and review progress over time. It supports a flexible exercise library with sports, categories, optional muscle groups, and exercises. All important data is stored locally with AsyncStorage. There is no server or cloud backend in this workspace.

Main user flow

Home -> Log Workout -> select sport/category/muscle/exercise -> enter sets -> save workout.

History and Progress read from the same saved workout records.

Quick Notes and the home background image are separate local features saved alongside workouts.

Claude Code notes

Category trees use parentCategoryId, with root categories stored as parentCategoryId = null.

Deleting a category removes its full descendant subtree.

Sports with requiresMuscleGroups = false skip the muscle-group step and route directly to exercises.

The default seeded library is Gym -> Push -> Chest with sample chest exercises.

Workspace Structure

Key folders and files to understand first:

Routes and screens

app/_layout.tsx - root stack, theme, and modal route configuration.

app/(tabs)/_layout.tsx - bottom tabs for Home, Log Workout, History, Progress, and Notes.

app/(tabs)/index.tsx - dashboard home with recent workouts and background image controls.

app/(tabs)/log-workout.tsx - starts the workout creation flow.

app/select-category.tsx, select-muscle.tsx, and select-exercise.tsx - workout library navigation.

app/log-exercise.tsx - enters sets, photos, notes, and saves a workout.

app/(tabs)/history.tsx and app/exercise-history.tsx - workout history views.

app/(tabs)/progress.tsx - workout stats, charts, and personal records.

app/(tabs)/notes.tsx - quick notes saved locally.

Data and logic

app/types/workout.ts - domain models for workouts, exercise library, categories, muscles, and sports.

app/utils/storage.ts - AsyncStorage persistence for workouts, library, notes, and the home background.

app/utils/stats.ts - progress calculations used by the analytics screen.

app/utils/helpers.ts - shared helpers such as ID generation.

Shared UI and support files

components/ - themed wrappers and shared UI primitives.

app/components/ - feature-specific UI like ExerciseHistoryCard and SetRow.

constants/theme.ts and hooks/ - styling and color-scheme helpers.

assets/ - image assets, scripts/ - project reset helper, app.json and eas.json - Expo config.
